

Avalanche® LOADER BOX PLOW

Key Features:

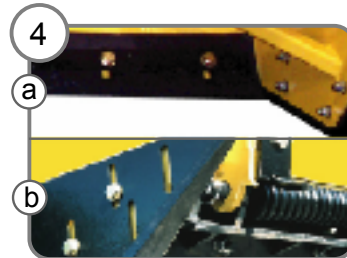

GRADE "8" BOLTS
To ensure extra durability, all Avalanche plows are crafted using heavy duty grade "8" fasteners.

PUSH PLATE & BUCKET MOUNT RECEIVER
Our receiver is made of solid steel plate. Cutting it from a solid slab makes the receiver more durable & resistant to corrosion & moisture build. Push plates on the push channel protect your investment because they prevent the bucket edge from scraping & deteriorating the channel support. They also provide load distribution. Horizontally mounted torsion springs provide trip action.

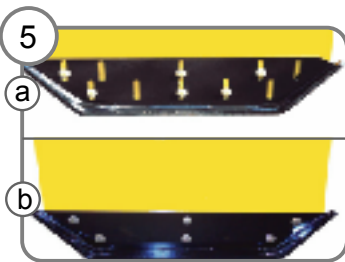

DOUBLE SIDE BRACES
Avalanche® LDAT & LDA-200 models are equipped with two square tube side braces. The engineered braces prevent the 50" high side panels from buckling under plowing stress or impact. They are positioned to withstand the maximum amount of impact.

PLOW EDGE OPTIONS
a. **FIXED RUBBER EDGE OPTION:** Using a top-of-the-line 85 durometer rubber compound in the cutting edge gives it a long service life. The cutting edge is reversible and adjustable.

b. **STEEL TRIP EDGE OPTION:** Using the Avalanche-pioneered steel trip edge system, gives you the ability to clear right down to the bare pavement, allowing collisions with objects such as manhole covers without damaging property or plow.

WEAR SHOE OPTIONS
ADJUSTABLE: Adjustable wear shoes are standard on all steel trip edge models.

FIXED: Fixed wear shoes are standard on all rubber edge models

*All wear shoes made with AR 400 steel.
